ReQuest Intros Hi-Def TV GUI

ReQuest (Booth 866) recently introduced a new graphical user interface (GUI) for its iQ whole-house music system, and is now introducing the GUI for use with the N-Series and F-Series media servers as well. The HD-TV GUI is a wide-screen interface that delivers total control of system operation through icon-based commands displayable on any large-screen television that accepts 720p or higher signals.

The new ReQuest HD TV GUI allows users to navigate all the sources and control

functions of their ReQuest system on-screen in 720p format via any HDTV, with fast, "pop-up/down" response. Any conventional infrared remote control can provide command of the TV-GUI using simple, easily learned (or programmed) directional-cursor codes. ReQuest also provides a full library of discrete control codes and code sets, including the all-important operating and music-programming functions, for installers or users who wish to integrate more complex control schemes.
